

REFERENCE · A MAJOR US BROADCAST NEWSROOM

They didn't buy another tool. They bought a **system flexible enough to match how they gather the news.**

When one of the country's largest broadcast newsrooms went looking for a home for its editorial workflow, the decision was not about features. It was about flexibility. They needed a structured system of record that could be molded to fit a newsgathering operation that runs 24/7 across 11 desks, not a rigid platform that would force the newsroom to work the way the software expected. That is why they chose Airtable.

10,000

stories published every month across 11 news desks running around the clock

300+

hours of senior editorial time lost each cycle to manual coordination that should be automated

11

news desks operating 24/7 with no single place to answer "are we on this?"

The newsroom publishes **10,000 stories a month** across 11 desks operating 24/7, with no single place to answer a basic question: **"are we on this?"**

Editorial work is scattered across dozens of Slack channels, texts, and emails, with senior editorial leaders losing **300+ hours of time** to coordination that should be automated.

Distinctive journalism drives revenue. The newsroom that protects its reporting capacity wins.

The media landscape is shifting faster than ever, and the ones that win will be those who have built the **operational infrastructure to fully embrace AI.**

This is the moment to show the ability to operate as a modern news organization when it matters most.

It is the only platform that gives a **structured system of record flexible enough** to match a newsroom's own way of newsgathering.

Embedded AI positions the newsroom as an industry leader, without forcing a new way of working on top of it.

THE REASON THEY BOUGHT

A structured system of record that molds to the newsroom, not the other way around.

Every newsroom runs its newsgathering and editorial workflow a little differently, and that difference is the point. Airtable's core flexibility lets a team define its own records, relationships, views, and automations to fit how stories actually move through its operation, from pitch to assignment to field coordination to publish, and then change it as the workflow evolves. The newsroom bought Airtable because it could be shaped to their way of working rather than forcing them into a vendor's fixed model. That is the foundation everything else, including the AI work below, is built on.

● FIELD AGENTS

AI researchers that monitor coverage around the clock

Field Agents watch the coverage landscape 24/7, surfacing signals, triaging incoming material, and doing the repetitive research work that pulls editors away from the story.

● OMNI

Answers to editorial questions in plain language

Omni answers editorial questions in plain language and builds production-ready apps from a natural-language prompt, so a desk can stand up a working tool without waiting on engineering.

Integrates with the tools your newsroom already runs on

Airtable connects natively to the systems of record a modern newsroom depends on, so it slots into your existing stack instead of replacing it. Push and pull from **Slack** for editorial coordination, sync with **Google Workspace** and **Microsoft 365**, trigger actions from **Gmail** and **Outlook**, and connect to **Salesforce**, **Jira**, **Box**, **Dropbox**, **Frame.io**, and dozens more through prebuilt integrations. If a system isn't covered out of the box, the open API and automation layer let your devs wire it in directly.

For your engineering team: everything in this doc is a front end on Airtable's developer platform. If your devs want to pressure-test the model, the API, automations, and scripting layer are all documented and open to build against.
